【Abstract】Objective To summarize the clinical characteristics of Vogt-Koyanagi-Harada syndrome (VKHS) combining with meningitis/encephalitis patients. **Methods and Results** The clinical data of the inpatients of Beijing Tongren Hospital, Capital Medical University from January 2009 to December 2022 with VKHS combining with meningitis/encephalitis were retrospectively analyzed. A total of 23 patients were included in the study, of which 20 patients (86.96%) had neurological symptoms, with headache being the most common (19 cases, 82.61%), 11 patients (47.83%) had increased cerebrospinal fluid (CBF) pressure, 14 patients (60.87%) had increased CBF white blood cells, and 11 patients (47.83%) had increased CBF protein. The brain MRI mainly showed white matter demyelination (8/14 cases). Optic nerve MRI showed inflammatory lesions of optic nerve and optic papilla (12/14 cases). The visual evoked potential (VEP) mainly showed prolonged latency (10/16 cases). The optical coherence tomography (OCT) showed retinal exudation (8/15 cases) and retinal neurocortical detachment (7/15 cases). The main results of fundus photography were disc edema (17/18 cases). The main manifestation of fundus fluorescein angiography (FFA) was uveitis (9/15 cases). After intravenous hormone and intravenous immunoglobulin (IVIg) treatment, 14 patients were followed up, and neurological symptoms were completely relieved, 11 patients had good visual prognosis, and 3 patients had no obvious visual improvement. **Conclusions** VKHS might present with meningitis/encephalitis symptoms, and the CSF characteristics of these patients were similar to those of viral meningitis. For those with early suspicions of VKHS, CBF examination and imaging examination might assist in early diagnosis and treatment.

讨 论

Vogt-小柳-原田综合征临床罕见,发病率较低,好发于20~50岁人群,无明显性别差异^[6]。Vogt-小柳-原田综合征是我国常见的葡萄膜炎病因之一,流

行病学调查数据显示,国外葡萄膜炎患者中Vogt-小柳-原田综合征占比为13.5%^[7],国内达37.7%^[8]。Vogt-小柳-原田综合征是一种多系统炎症性疾病,其特征为含黑色素细胞的组织色素沉着、形成“晚霞”样或“夕照”样眼底以及各种皮肤毛发症状,如脱发、白发、白癜风^[9-10]。早期规范治疗可使大部分患者完全治愈,恢复较好的视力^[11-12];若不及时规范治疗,可并发白内障、继发性高眼压症或青光眼、脉络膜新生血管、多灶性和片状脉络膜视网膜萎缩、Dalen-Fuchs结节、黄斑病变、角膜带状变性、视网膜

图6 女性患者,49岁,临床诊断为完全性Vogt-小柳-原田综合征。OCT显示视网膜神经上皮层脱离;脉络膜表面波浪形改变,以右眼为著

Figure 6 A 49-year-old female patient clinically diagnosed as complete VKHS. OCT showed detachment of retinal nerve epithelium and wavy changes on choroid surface with more obvious in the right eye.

下纤维化等,可导致视力严重下降^[11,13-14]。Vogt-小柳-原田综合征的发病机制至今尚未阐明,目前认为可能由T淋巴细胞介导,感染因子触发CD4⁺T细胞对黑色素细胞的特异性蛋白反应^[15],同时易感基因HLA-DRB1*0405促进这一过程^[16]。目前的Vogt-小柳-原田综合征中国标准^[17]和分类标准^[18-19]主要侧重眼部症状和眼科检查,而临床实践中患者常处于疾病不同发展阶段,早期可因头痛、发热等症状就诊于神经内科,因此神经内科医师应同时关注眼部症状和神经系统症状,建议首诊患者积极进行眼科检查。

Vogt-小柳-原田综合征伴发中枢神经系统症状的发生率可达93%^[20],最常表现为头痛、颈项强直、发热、恶心、意识模糊等脑膜炎症状,亦可表现为罕见的局灶性神经功能缺损的脑炎症状,如轻偏瘫、人格改变、癫痫发作、共济失调、眼震、脑神经病变、下肢轻瘫和括约肌障碍^[21]。影像学表现为脱髓鞘改变,伴或不伴强化征象,可同时累及小脑半球、大脑脚、被盖、基底节、内囊、壳核和大脑半球、脊髓等多部位^[22-26]。本组23例患者中枢神经系统症状发生率为86.96%(20/23),以头痛为主(82.61%,19/23);影像学异常主要表现为脑白质脱髓鞘改变(34.78%,8/23),但病灶相对局限,症状较轻微,考虑颅内受累范围可能与疾病严重程度相关。Vogt-小柳-原田综合征患者对髓鞘碱性蛋白(MBP)具有超

敏反应^[27],针对髓鞘成分抗原或针对黑色素细胞和神经组织相关抗原的自身免疫可能在脑实质炎症中发挥作用。有文献报道,伴脑膜炎和(或)脑炎的Vogt-小柳-原田综合征患者脑脊液多核细胞比例增加或葡萄糖水平降低,与感染性脑膜炎或脑膜脑炎难以鉴别^[21],此类患者常伴发严重的神经系统并发症。然而本组患者脑脊液细胞学以单核细胞为主,与Kato等^[28]的研究相一致,考虑可能与疾病早期尚未形成严重不可逆的神经系统损害有关^[21]。

根据2007年Rao等^[3]提出的《Vogt-小柳-原田综合征诊断标准》,疾病早期视觉障碍和神经系统症状不典型时,头部影像学或腰椎穿刺脑脊液检查证实脑膜脑炎,可有助于早期识别及诊断。MRI是检测Vogt-小柳-原田综合征患者脑或脊髓病变的首选方法,脑膜增厚或强化易与感染性脑膜炎相鉴别。目前已有学者发现,多模态成像可辅助临床更好地诊断和动态监测疾病进展^[29]。Vogt-小柳-原田综合征患者的脑脊液异常主要表现为白细胞计数增加(10~463个/mm³)和蛋白定量水平升高(40~128mg/100ml)^[23,30-32]。本组患者的脑脊液表现与无菌性脑膜脑炎类似^[33],且脑脊液异常率明显高于影像学检查异常率,表明对于早期Vogt-小柳-原田综合征患者,脑脊液检查可能较影像学检查更敏感,尚待进一步验证。

经早期诊断和及时治疗,Vogt-小柳-原田综合

征患者视力预后通常较好^[9,16,34-35]。Miyanaga等将32例Vogt-小柳-原田综合征患者分为两组,A组经脑脊液检查辅助早期诊断并予大剂量激素冲击治疗,B组予以常规流程的诊断与治疗,发现A组Vogt-小柳-原田综合征诊断率达100%(22/22),显著高于B组(6/10),治疗后所有患者视力均至少恢复至0.8。因此认为,早期眼部症状不典型且影像学检查呈阴性结果时,建议完善脑脊液检查以确定是否累及中枢神经系统,有助于疾病的早期诊断与治疗,从而挽救视力,改善预后。此外,对于常规激素和其他免疫抑制剂治疗欠佳或不宜长期治疗的患者,阿达木单抗等生物制剂可能有效,但长期有效性和安全性有待进一步评估^[37]。

本研究为单中心研究,样本量较小,可能存在选择偏倚;回顾性研究方法使得出院后药物减量方案无法保持一致,治疗存在异质性;随访时间差异性较大,失访患者相对较多;结局观察指标主要为临床症状的转归,缺乏影像学、电生理检测、眼底检查等客观指标,对疾病转归的判断不够全面。未来尚待开展多中心、大样本、前瞻性研究,进一步探讨腰椎穿刺脑脊液检查、影像学检查等能否有助于优化Vogt-小柳-原田综合征的早期诊断、治疗及预后。
